TITLE:

Mongolian-Okhotsk Geosynclinal Region and its Place in the Structure of Eastern Asia (Mongolo-Okhotskaya geosinklinal'-naya oblast' i yeye mesto v strukture Vostochnoy Azii)

PERIODICAL:

Byulleten' Moskovskogo Obshchestva Ispytateley Prirody, Otdel Geologicheskiy, 1957, #6, pp 128-129 (USSR)

ABSTRACT:

The author lists several stages of intensive sinking and accumulation of sediments in the long and complicated history of development of the Mongolian-Okhotsk geosynclinal region. This region represents a combination of the inherited and superimposed types of geosynclinal development. The inheritance consists in that the strike of the Lower-Sinian, Lower-Cambrian and Middle-Paleozoic depressions approximately coincides with the strike of the Mesozoic depressions; the superposition manifests itself in that geosynclinal stages are separated by the long stages of geoanticlinal regime.

TITLE:

A Geological-Structural Diagram of USSR Far East and Contiguous Territories to the South (Geologo-strukturnaya skhena Dal'nego Vostoka SSSR i sopredel'nykh s yuga territoriy)

PERIODICAL:

Doklady AN SSSR, 1957, Vol. 117, Nr 3, pp. 473-475 (USSR)

ABSTRACT:

The structural connections of the southeastern part of the USSR and the northeastern parts of Mongolia and China are interesting, because here a number of tectonic problems of Eastern Asia are solved. The most important question is, how far the Chinese platform is advanced northward, and which type of fold systems fill the immense area between the Siberian and the Chinese platform. Figure 1 gives a fragment of the tectonic chart of the USSR (according to Shatskiy 1956) with the largest geosynclinal territory of the continental part concerned. Not long ago it could be cleared up that the centrosphere of the old Kheg:.no-Bureinskiy-massif, - a part of the already in Pre-Cambrian splintered Chinese platform, being advanced widest northwand extends into the meridional direction from the Ussuri river to the lower courses of the Sunfari- and Bureya-rivers. Data

Card 1/4

A Geological-Structural Diagram of USSR Far East and Contiguous Territories to the South

on the uniformity of this massif are still lacking just now. With respect to the massif, the Upper Paleozoic- and younger (up to Upper Crextaceous) granite intrusions intersecting that one, are peculiar. The diagram (figure 1) reflects a distinct difference between the Mongolo-Okhotskaya and Sikhote-Alin'skaya synclinals. The first one is an example of the bequeathed type of the geosynclinal development; the latter one an example of the "superimposed" type ("nazlozhennyy tip"); the plans of the older and younger synclinals differ from each other. The deficiency of knowledges on the structure of the district northern of the Chinese platform was partly tilled not long ago. The northern limit of the platform passes almost along the Silyaokhe-river. In the district of the Bol'shoy Khingau and not far from Girin, there already occur marine geosynclinal facies of the Middle- and Upper Paleozoic, which may be brought into connection with the corresponding structure levels of the Mongolo-Okhotsk- and Sikhote-Alin'-geosynclinals. Since the Triassic differenciated motions began, causing large uplifts and locally narrow flexures, limited by fractures.

PENDER PROPERTY AND PROPERTY OF THE PENDER PENDER PROPERTY OF THE PENDER PENDE

A Geological-Structural Diagram of the USSR Far East and Contiguous Territories to the South

20-3-32/52

In the flexures rather mighty effusive-sedimentary masses of the Mesozoic accumulated, which were thrown into folds during the Jurassic and Cretaceous. Intrusive magmatism is widely distributed, and important pre occurence is connected with it. In the middle of the Man'chzhurskaya plane, there, apparently, is an old central massif. It remains uncertain, if it was a part of the Chinese platform before its breaking down. The development of the geosynclinal zone, contiguous to the platform from the north, lasted up to the end of the Permian. Therefore it is to separate as the Mongolo-Girin synclinal. During the Mesozoic mighty vulcanogenic-sedimentary masses accumulated at the eastern slope of the Bol'shoy Khingan. Between the limits of the Northern-Manchzhurskaya- depression there occurred no fold motions, only during the Cretaceous at the borders occurred mighty fractures with small andesite-, trachyt-, and liparite intrusions. Since the Tertiary the development of the platform-shaped south and of the geosynolinal north of Northeastern China passed very similar ways. The intensity of the bit-movements ("glybovyye dvizheniya") rapidly sank down, volcanism became weaker and was almost only represented

Card 3/4

A Geological-Structural Diagram of the USSR Far East and 20-3-32/52 Contiguous Territories to the South

by basaltic effusions. After those ones the period of the recent uplifts began. Large Mesozoic fractures elevated again, and along them effusions of Quarternary basalts, as well as formation of volcanic cones together with eruptions began. There are 1 figure and 2 references, all of which are Slavic.

PHASE I BOOK EXPLOITATION

sov/1198

Vsesoyuznyy nauchno-issledovatel'skiy geologicheskiy institut

- Geologicheskoye stroyeniye SSSR. t. 3: Tektonika (Geological Structure of the USSR v. 3: Tectonics) Moscow, Gosgeoltekhizdat, 1958. 383 p. 8,000 copies printed.
- Ed.: Krasnyy, L.I.; Ed. of Publishing House: Babintsev, N.I.;
 Tech. Ed.: Gurova, O.A.; Editorial Board: Belyayevskiy, N.A.
 Vereshchagin, V.N., Librovich, L.S., Markovskiy, A.P. (Resp. Ed.),
 Muzylev, S.A., Nalivkin, D.V., Nikolayev, V.A., Ovechkin, N.K., and
 Polovinkina, Yu.Ir.
- PURPOSE: This standard book on the tectonics of the USSR is intended for scientists and students of geology.
- COVERAGE: The present volume, one of a series on the geology of the USSR written in commemoration of the 40th anniversary of the Soviet Revolution, covers the tectonics of the country. Based mainly on the earlier studies of A.P.Karpinskiy, A.P. Pavlov, A.D. Arkhangel'skiy and N.S. Shatskiy on the Russian Shield, this

Card 1/8

Geological Structure of the USSR (Cont.)

sov/1198

work constitutes an up-to-date summary of information accummulated on the subject and interpreted by Soviet geologists. In the preparation of this volume advice and assistance was provided by A.Ya. Dubinskiy, L.S. Librovich, V.P. Nekhoroshev, Yu.Ir. Polovinkina, T.N. Spizharskiy and others of the (VSEGEI) All-Union Scientific Research Geological Institute. The terminology used is in accordance with the latest tectonic map of the USSR, 1:5,000,000 scale (1956) prepared under the direction of N.S. Shatskiy and the joint editorship of N.A. Belyayevskiy, A.A. Bogdanov and M.V. Muratov. The book cites numerous prerevolutionary and Soviet geologists who have contributed to this field and developed theories in the following: 1) formation of geosynclines, by A.A. Borisyak, Ye.V. Milanovskiy, N.M. Strakhov, V.V. Belousov, V.Ye.Khain, V.A. Nikolayev et al. 2) theory of abyssal breaks (dislocations) by A.V. Peyve, 3) tectonics of folded areas, by V.N. Veber, D.V. Nalivkin, V.A. Nikolayev (Central Asia), N.G. Kassin (Kazakhstan), M.A. Usov (West Siberia), V.V. Belousov (Caucasus); M.V. Muratov (Black Sea region), et al. In exploring for coal, information on tectomics was successfully used by L.I. Lutugin, P.I. Stepanov and Yu. A. Zhemchuzhnikov; in petroleum geology by D.V. Golubyatnikov and I.M. Gubkin and in mineral exploration by S.S. Smirnov and Yu.A. Bilibin. A general schematization of Soviet tectonics was developed in the early 30ths by M.M. Tetyayev, D.V. Nalivkin, A.D. Arkhangel'skiy and N.S. Shatskiy. The latest tectonic maps show advances in surface and subsurface

Card 2/8

Geological Structure of the USSR (Cont.)

SOV/1198

knowledge of USSR crystal structures. A contributing factor here was the use of geophysical exploration methods, both surface and air-borne. The first part of the book deals with regional tectonics of shields, cratons, and ancient crystalline massifs and adjacent folded areas. Study of separate areas was mainly confined to the lesser known parts of Asiatic USSR. A chapter devoted to the most recent tectonic movements in USSR territory treats also the processes affecting the configuration of contemporaneous relief. The names of more than 40 scientists participating in the work are given in the appropriate chapter headings in the table of contents. General editorship was in the hands of L.I. Krasnyy assisted by B.B. Mitgarts. There are 26 inserts. There are no references given.

(Candidate of technical sciences); Krasnyy (Engineer) TITLE: Investigation of an induction capacitor servomotor by the mathematical simulation method SOURCE: Elektrotekhnika, no. 2, 1965, 1-5 TOPIC TAGS: servomotor, capacitor servomotor, induction servomotor, mathematical simulation, drag cup servomotor ABSTRACT: A drag-cup capacitor servomotor was simulated on an a-c calculating board, and its characteristics and performance were analyzed by the method of symmetrical components. The effects of the machine parameters and capacitor value on these operating and starting characteristics were investigated: no-load speed, rated speed corresponding to the maximum output shaft power, Card 1/2

L: 40967-65

ACCESSION NR: AP5006238

starting torque ratio, nonlinearity of the mechanical characteristic, and linear-regulation zone. The above characteristics in relative units are presented as curves. These conclusions are offered: (1) The method of mathematical simulation is suitable for calculating those capacitor servomotors which have complex relations between their parameters and output characteristics; (2) Such a simulation yields general relations between the machine parameters and excitation-circuit capacitance on the one hand and its output characteristics on the other; (3) The relations thus obtained can be used for designing servomotors with specified characteristics. Orig. art. has: 11 figures, 14 formulas, and 2 tables.

ACC NR: AP6013418

0

the electromagnetic power in starting and P_{in} is the power consumed in starting; (2) The specific control power $P_c = P_c / P_{em}$, where P_c is the control power in watts; this factor shows the control power required for producing one synchronous watt in starting. The formulas developed for the coefficient of utilization permit designing minimum-size motors with an elliptic rotating field. To further minimize the size, a circular rotating field is recommended for the starting period. The selection of motor parameters ensuring minimum control power is specified. Orig. art. has: 9 figures and 28 formulas.

$$-T_H + \frac{\eta_0}{\kappa_0} \frac{\beta}{\beta + \gamma} \sigma_0^2 \sigma_0 \frac{e^{-\gamma H}}{1 - e^{-\beta H}}$$
(9)

Values for the heat flux vector, energy flux density vector and momentum flow density tensor were computed on the basis of equations 7 through 9. The derived solution corresponds in its physical sense to a streamline flow of liquid along axis x1, resulting from a constant surface force (stipulating an exponential variation of the liquid's heat conductivity and viscosity with depth). The authors also consider a problem on heat wave propagation in liquids at rest and calculate a trajectory for the travel of thermal disturbances in sea water. V.M. Kamenkovich.

32910-66 ACC NR: AP6023830 (A,N)SOURCE CODE: UR/0326/66/013/001/0177/0133 AUTHOR: Krasochkin, R. V.; Moshkov, B. S. ORG: Agrophysical Institute, Leningrad (Agrofizicheskiy institut) TITLE: Study of the growth and geotropic reactions of plants under conditions of centrifugal forces SOURCE: Fiziologiya rasteniy, v. 13, no. 1, 1966, 177-183 TOPIC TAGS: # plant growth, centrifugal force, gravitation effect, plant physiology; environment/test chamber, gravity plant effect ABSTRACT: Investigations were conducted to determine: 1) the possibility of the complete nullification of the physiological effect of gravity by means of rotations and 2) the possibility of the substitution, in a broad physiological sense of the Word, of centrifugal force for gravity. A special centrifugal device which makes it possible to determine the effect of rotation on the growth of plants has been designed and built. The device differes from those hitherto used in that it provides analogous growth conditions for experimental and control plants. The special centrifugal device consists of a wheel with a-horizontal-rotation axio. - The diameter of the wheel is two meters; its width is 0.5 meters. Its main part is a reel with rings connected by steel bolts. The outer rings of the reel make possible the rotation of the wheel. The plants under investigation are placed in special vinyl

ACC NR. AP6023830 vessels made from pipe section 30 centimeters long and five centimeters in diameter. Rotation of the wheel is accomplished by an electric motor. The data obtained in the investigations established that the rotation of plants under conditions of an artificially created centrifugal force tends to exclude the physiological effect of gravity on certain reactions of the plants; the complete exclusion of the effect of gravity on the plant organisms was not noted even at a rotation rate of 36 revolutions a minute; the effect of a constant centrifugal force with respect to geotropic reactions, and with relation to the growth of the plant and the accumulation of organic masses is similar to that affected by gravity. Abstract

: On the basis of an analysis of data published and experiments, the author comes to the conclusion that the species closest to the original ancient ancestor of the clured beet is a specie of sea-shore beet (B. maritima L.). The oriental beet (B.orientalis Roth) formed later, under tropical climatic conditions. The Scadinavian beet which formed in northern latitudes is distinguished by a high content of dry matter and sugar in the root t ber, winter resistance, two and more years perenniality. The widespread opinion that the root t ber beet originated

as the result of the application of hybridization is incompetent since prior to the appearance of the root teber forms, the foliated beet was cultivated which acquires ability to form root tabers by means of repeated selections. For the creation of semitaberous forms, a prolonged vegetative period is necessary. In the experiments, the foliated semi-tubers (Mangold, with red petioles, No 33 variety) produced a tuber of the average weight of 537 grams ader the condtions of high caliber agric Itural technique and a long vegetative period of Maykop; hear Minsk - 240 grams, hear Lehingrad - 90 grams. Formation of the present time root t ber varieties took place in the mountains of East Asia, Soviet Trans-Caucasus, and later in Europe. The origin of the contemporary sugar beet is related to the fodder varieties and the northern wild beet distinguished by greater saccherosity. -- M.K. De lina

: Perfecting the Bestuzhevskaya Breed

Orig Pub

: Zhivotnovodstvo, 1958, No 3, 52-59 - Vol. 20

Abstract

: The Bestuzhevskaya dairy-beef cattle breed was created as a result of complicated crossings of local cattle with various other breeds (Durham, Shorthorn, Dutch, Tyrolean, Simmenthal, Wilstermarsh, Ayrshire, Kholmogorskaya) which was periodically replaced by long-lasting breeding in "itself" (inbreeding) and an inverse crossing with aboriginal cattle. In 1957 more than 370,000 heads were counted within the entire distribution area of the breed. Valuable strains and families were created; highly milk productive herds are

in existence, as well as record-breaking cows, etc. However, the work of breeding cattle is not performed sufficiently enough. It is imperative to keep the following standards for the breed: in 1st grade cows the milk yield for 300 days after the first parturition should be 300 kg, their live weight should amount to 400 - 420 kg; after the second, third and more parturitions, the figures should be correspondingly 2600 kg and 3200 - 3500; 450 - 500 and 530 - 580 kg. The milk's fat content should not be lower than 3.9 percent. Sires should weigh at least 800 kg at the age of 5 years. -- V. I. Orlov

A.; Shan'kova, Z. N.; Krasota, V. ORG: none TITLE: Mechanized ultrasonic normal wave flaw detector for automatic quality control of aluminum alloy plates SOURCE: Defektoskopiya, no. 4, 1965, 56-60 TOPIC TAGS: ultrasonic inspection, aluminum alloy, alloy sheet, alloy plate, plate ultrasonic inspection, ultrasonic flaw detector, automatic flaw detector, quality control ABSTRACT: The design and the operating principles of a UDK-2L ultrasonic flaw detector for automatic quality control of aluminum alloy plates and sheets are described. The flaw detector operation is based on the pulse-echo method using normal antisymmetric waves which undergo a maximum reflection from laminations in the fd range of 6-12 Mc mm (f is the ultrasound frequency and d is the metal thickness). The UDK-2L flaw detector has two control channels and operates with three fixed frequencies: 1.8, 2.5, and 5 Mc. It is provided with several pairs of interchangeable search heads, each of which is designed for a certain alloy and a definite range of thicknesses. The UDK-2L is capable of separating a pulse reflected from a flaw located at a distance of 1200 mm in sheets of AMg6 aluminum alloy A Preliminary statistical data showed that the UDK-2L ensures detection of laminations 20-30 mm long and 1/2 UDC: 620.179.16

TITLE: Conditions of carbon nutrition of Chlorella in intensive cultures

SOURCE: AN SSSR. Otdeleniye biologicheskikh nauk. Problemy kosmicheskoy biologii, v. 4, 1965, 676-682

TOPIC TAGS: Chlorella, photosynthesis, carbon dioxide, oxygen, plant growth, closed ecology system, exchange reaction

amounts of CO₂ required for maximum production of oxygen by Chlorella under conditions of intense cultivation. Experiments were performed in a closed system with a g/liter gas volume. This arrangement made it possible to perform three experiments using the same culture without any substantial modification of the density of suspension of conditions of the medium. A previously grown culture of Chlorella was centrifuged for 15 min

Card 1/4

L 14256-66

ACC NR: AT6003907

(at 3-4000rpm), after which the culture was re-suspended in a fresh Tamiya medium. A mixture of air and CO₂ was supplied to the culture by a diaphragm pump at the rate of 3-4 liters/min. A reactor, based on a membrane method of cultivation, assured good conditions of gas exchange between the open surface of the suspension and the air. The photosynthetic rate was determined as a function of the diminishing concentration of CO₂ in the closed volume of the system by means of a continuous automatic gas analyzer (UAV-1). In the tests CO₂ concentrations ranged from 13% down

to the point where photosynthesis apparently ceased. The pH of the medium varied from 5.5 at the beginning of the experiment to 6.0 at the end. A special thermophylic strain of Chlorella with a temperature optimum of 40-41°C was used. The following densities of Chlorella suspensions were used in the tests: 0.5-0.6 x 10°, 3-4 x 10°, and 8-10 x 10° cells per cc. The results in all three tests were quite similar. The intensity of photosynthesis increased sharply as the amount of CO2 in the air was increased to 1.5-1.8%. Further increases in CO2 concentration did not increase the intensity of photosynthesis until 4.5-5.5% was reached. At this concentration another sharp increase in intensity of photosynthesis was observed. Here a

Card 2/4

L 14256-66

ACC NR: AT6003907

second plateau, where increases in CO_2 did not increase the intensity of photosynthesis, was encountered. This plateau lasted until the concentration of CO_2 in the air reached 7.0—7.5%, at which point a third sharp increase in photosynthesis took place. Further increases in the productivity of the culture. However, this was not accompanied by any depression in the intensity of photosynthesis. It should be noted that the third plateau was reached only with a concentration of 8—10 x 10^9 cells per cc. Lower concentrations of Chlorella cells provided only 2-step increases.

The step-like nature of the graphs obtained in the experiments is apparently explained by factors which delay the arrival of CO₂ to the point where it can be utilized by the cell. The rate of CO₂ utilization by the cells has a direct effect on the magnitude of the partial pressure of CO₂ in the air. This probably explains the presence of the third plateau in high-density cultures and its absence in cultures where the utilization rate of CO₂ is slower.

Refractories in the Hands of the User (Ogneupory u potrebitelya). Refractory Highly Aluminous Bricks for Ladles and Arresting Tubes Made of a Substance Composed of Mullite and Corundum (Termostoykiy vysokoglinosemistyy kovshevoy kirpich i stopomyje trubki mullito-

korundovogo sostava)

PERIODICAL:

Ogneupory, 1957, Nr 12, pp. 546-549 (USSR)

ABSTRACT:

According to a working method developed sets of ladle bricks and arresting tubes manufactured by the industry were tested in practice. The durability of these bricks was found to be 50% greater than that of ordinary fireclay bricks. Furthermore, the manufacture and practical testing of a set of refractory highly aluminous ladle bricks made of a mullite-corundum composition is described in detail, in which steel of different melts was cast. In conclusion it is

1.) The ladles lined by highly aluminous bricks are able to stand 18 stated that: melts instead of the average of 11.8 in the case of ordinary fireclay bricks, and that with these bricks no cracking or
